

MY EXPERIENCE

Let me introduce myself, my name is Artanti Nayla Wulandari, and I am a beginner who is currently learning in the field of web development. I have an interest in creating website designs that are attractive, neat, and responsive. I want to continue developing my skills so that I can create websites that are not only visually appealing but also comfortable to use.

When I first started learning web development, I began with the basics, namely HTML, to understand the structure of a website, such as headings, paragraphs, images, buttons, and various other elements. At first, it was quite confusing because there were many tags to understand, but over time I gradually became familiar with them.

After that, I learned CSS to make the website appearance more attractive. I learned how to manage colors, text sizes, spacing, positions, and layouts so that the website would look more interesting and organized. From this, I understood that design plays an important role in giving a professional impression to a website.

Next, I started learning JavaScript to add interaction to websites, such as clickable buttons, navigation menus, simple pop-ups, and other animations. This made me even more interested because websites became more lively and interactive.

I also learned to use Bootstrap to make the website creation process easier, especially in building responsive layouts and components such as navbars, cards, and buttons more quickly. In addition, I started using Tailwind CSS, which helped me create modern designs in a more flexible and efficient way.

During my learning process, I also tried creating simple projects such as personal portfolio websites, landing pages, and contact pages. These projects helped me understand how to combine HTML, CSS, JavaScript, Bootstrap, and Tailwind CSS into one complete website. I also learned how important planning and design are before starting the coding process.

From these experiences, I learned that building a website requires patience, practice, and the willingness to keep trying. Even though I am still in the learning stage, I believe that with consistency and the spirit to grow, I can become better in the world of web development. I hope that in the future, I can create more useful and professional websites that can help many people and improve my skills even further.
